

# DB Practical Work 0: Setting the system up

December 13, 2016

## **Abstract**

The following leaflet gives the steps to set the development environment up.

## **Contents**

<b>1</b>	<b>Work to do</b>	<b>2</b>
<b>2</b>	<b>Installation</b>	<b>2</b>
2.1	On the Virtual Machine . . . . .	2
2.2	On a personal machine . . . . .	2
<b>3</b>	<b>Get the system to work</b>	<b>3</b>

## 1 Work to do

You have to set your system up in order to get a proper development environment.

## 2 Installation

### 2.1 On the Virtual Machine

1. Download <https://github.com/prafiny/db-project/archive/master.zip>
2. Get the VM called "VMWARE WINDOWS 7 PRO 32 bits - MISE EN OEUVRE BDD"
3. Put the archive in the VM and unzip it.
4. Start WampServer.
5. Open a cmd prompt (Shift+Right Click on the folder `db-project-master`)
6. Run `composer install`

### 2.2 On a personal machine

You will need the following elements for the software to work:

- PHP  $\geq 5.6$
- MySQL/MariaDB
- Apache and PhpMyAdmin
- Composer (<http://getcomposer.org>)
- php.exe in PATH (see <https://john-dugan.com/add-php-windows-path-variable/>)
- No xDebug : in php.ini, comment out the line `zend_extension = "/path/to/php_xdebug.dll"` (adding ; at the beginning)

Once you have got all the requirements fulfilled, you can proceed with the following steps :

1. Download <https://github.com/prafiny/db-project/archive/master.zip>
2. Unzip the archive somewhere.
3. Open a cmd prompt (Shift+Right Click on the folder `db-project-master`)
4. Run `composer install`

### 3 Get the system to work

1. You must have two databases : one for testing and one for the application
2. You must have the tables you are working on on both databases
3. Edit the config/db.yaml.example file (replacing the infos with the MySQL connection infos) and save as config/db.yaml
4. Run a server by opening a commandline (Shift+Right folder **db-project-master**):

---

```
php -S localhost:8888 -t www
```

---

5. Your application is available at the address **http://localhost:8888/**
